Project Report

Purpose of this project is to create a web application to provide exhibition space for artists to

showcase

their work and connect artists with the community. This application will maintain a database of art

items and will support two types of users: patrons and artists. Patrons can browse all the information

on

the site, add reviews and “likes” to artwork, “follow” artists, and join workshops. Artists will be able to

add new artwork or host a workshop.

First of all, web app build with express;"npm install express" , mongodb; npm install mongodb,

pug; npm install pug,

use of http request, template engine rendering, initializing; node initializer.js ; then run my database

and server.

"node initialize.js" script in .zip.

```
const express = require('express');

let app = express();

let fs = require('fs');

let mongo = require('mongodb');

let MongoClient = mongo.MongoClient;

let db;

let artWork = [];

fs.readdir("./database",(err,files)=>{
```

```
if(err){
return console.log(err);
}
 else{
for(let i=0; i<files.length; i++){
let file = require("./database/"+files[i]);
for (let j=0; j < file.length; ++j){

artWork.push(file[j])
console.log(file[j])
}
}
}
});
MongoClient.connect("mongodb://localhost:27017/", function(err,client){
if (err) throw err;
 db = client.db('project')
 app.locals.db=db;
 app.locals.db.listCollections().toArray(function(err,result){
if(result.length==0){
app.locals.db.collection("artworks").insertMany(artWork, function(err,result){
if(err){
throw err;
}
console.log(result.insertedCount)
```

client.close();

})

return;

}

})

})

created batabase a new MongoDB database from my updated gallery.json file with 12 Artworks,

this database can add/remove/update the keys and values.

This database ensures that a database with the data structure required by my project can be created

during the grading

process.

Discussion : project critique of my overall design. The overall quality of this Project system's design

and

implementation are good.

File includes :

database

- gallery.json

Public

- addUser.js

- artistRouter.js

- artWorkRouter.js

- style.css - not use

-deleteUser.js

-register.js

- login.js

-userRouter.js

views

- addUser.pug

- artist.pug

- artists.pug

- artwork.pug

- artworks.pug

- headers.pug

- home.pug

- login.pug

- newartist.pug

- newartwork.pug

- newuser.pug

- register.pug

- user.pug

- users.pug

initializer.js

server.js

README.txt

Report.pdf

quality and organization and effective Use of RESTful design principles, use of proper HTTP status

codes,

proper error handling, use of asynchronous operations, minimization of required data transfer.

good design/implementation properties are my home page has implemented easy to follow.

Explanation of design decisions that route steps in header page.

Routes:

Get/artworks

- renders the homepage with all artworks and details

- response is html

Get/artists

- renders the homepage with all arttists and details

- response is html

Get/users

- renders the homepage with all users and details

- response is html

Get/artwork/:id

- renders display artwork on seperate page

- response is html

Get/artist/:id

- renders display artist on seperate page

- response is html

Get/user/:id

- renders display user on seperate page

- response is html

Get/addArtwork

- renders display artwork on seperate page

- response is html

Post/

- create new Artwork

- create new Artist

- create new user
